

FITLINE.

Your body picks the size, not your guess.

Fitline tells every shopper their size in **every product** from a tape measure or a single phone photo, and explains why in plain words. It runs entirely in the browser and is built into a working D2C streetwear store, **Senpai Supply**.

01 THE PROBLEM

25-40%

of apparel bought online in India is returned, the highest of any category.¹

~70%

of fashion returns are caused by size and fit.²

2 in 3

Indian shoppers choose a size from past buys or gut feel, not measurements.³

"M" means something different in every cut. Your body doesn't.

Every wrong guess becomes two-way shipping, handling, and often a lost customer. Fitline removes the guess at the moment of purchase.

02 THE PRODUCT, WORKING TODAY

YOUR SIZE IN MIDNIGHT RONIN

M — S gives your hip only 14cm of room; this cut is designed for 19-26cm.

Oversized cut: sizes are judged against 19-26cm of room, not the regular 5-12cm.

● strain ≤ 16 cm ● tight ≤ 19 cm
● in range ≤ 26 cm ● loose ≥ 26 cm

Showing M, the recommendation

The size, and the reason. Each region is checked. The one that decides the size is named, with its centimetres.

Size fit on you

On you, to scale. Compare sizes, or try it on live on camera.

YOUR SIZE: M YOUR SIZE: S YOUR SIZE: XL

One body profile, three different sizes. The same shopper is **M** in the oversized tee, **S** in the regular tee and **XL** in the fitted rib tee. Fitline saves the body once, and every product card then shows *your* size.

03 HOW IT WORKS

1 Capture

Tape-measure numbers, or one photo or live camera frame plus your height. There's no app, no hardware and no sign-up.

2 Measure

On-device pose detection and a body mask (MediaPipe) remove the arms and read torso width at chest, waist and hip. Height sets the scale. Width becomes circumference, with a $\pm$ margin.

3 Fit

$\text{room} = \text{garment} \times \text{stretch} - \text{body}$ for each size and region, judged against the cut's intent (oversized = 19-26 cm). The tightest region decides the size.

4 Explain

The size and one line saying why ("S gives your hip only 14 cm of room"), plus a room-by-size table, a to-scale preview and a live 3D try-on.

04 WHY IT WINS

- **Private by design.** All processing runs on the phone, so photos never leave it and no body images are stored anywhere.
- **Near-zero cost per shopper.** There's no cloud GPU and no fee per scan. Traffic grows, costs don't.
- **Uses the charts brands already have.** Paste the size chart and set the fabric stretch and cut. There's no garment scanning.
- **Explains itself.** Every pick names the body region and the centimetres behind it, and shoppers trust a reason more than a badge.
- **Honest when unsure.** It shows $\pm$ ranges, flags close calls, and warns about loose tops or crossed arms instead of guessing.
- **Drives the next sale.** Your size appears on every product card, not just on this one.

05 IMPACT & PROOF

Illustrative D2C brand, 10,000 orders a month

Orders returned (30%)	3,000
...of which for size or fit (70%)	2,100
At ₹150 per return (shipping + handling)	₹3.15 L / mo
Fitline prevents 1 in 4 size returns	≈ ₹9.5 L / yr

These are assumptions, not measured results. The figure excludes revenue kept and repeat purchases.

Pilot: an A/B test on one catalogue, comparing **size/fit return rate**, conversion and exchanges with and without a Fitline profile.

Next: train our own computer-vision model on tape-measured bodies, so that it learns 3D body shape and gives tighter $\pm$ ranges. Then take the same engine to other markets where fit decides the sale: **footwear, eyewear, uniforms and tailoring.**
